Territorial socioeconomic structure along the GSA 6 and its fishing footprint

Socioeconomic Organization and main Management measures along GSA6

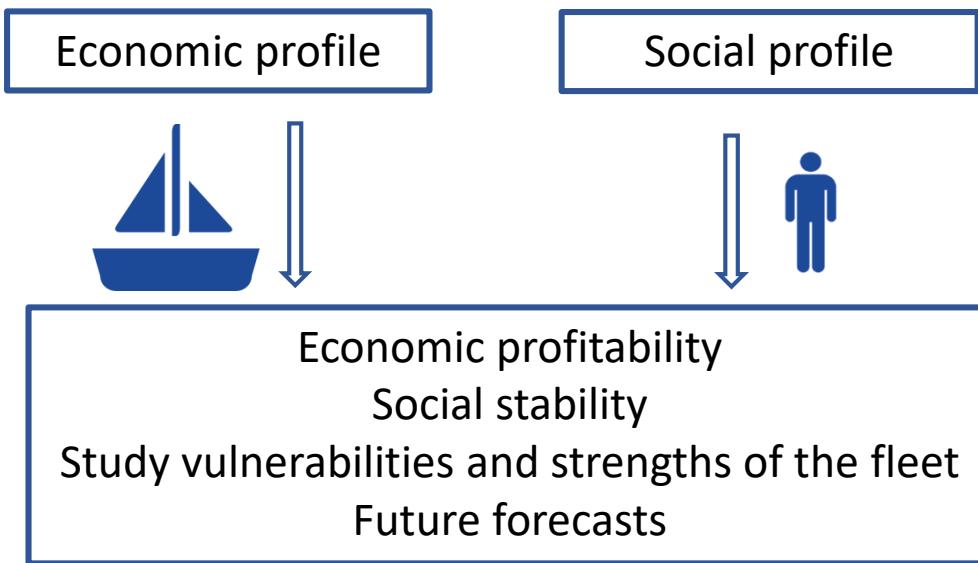

1. *Castello Management Plan applied from the 60s:* Five days per week at sea with a maximum of 12 hours per day. This daily fishery capability implies that fishing vessels only can fish in fishery grounds nearby their fishery harbour (maximum of 25 miles navigation).
2. Mesh size: 40 mm square (fully implemented in GSA 6 and 5 since 2010).
3. Minimum Conservation Reference Sizes (MCRS): not fully applied and many of the official MCRS are not according Size-at-First-Maturity.
4. Maximum Engine capacity of 500 HP: Spanish regulation applied since the 80s but with non-compliance.

Socioeconomic importance of fishery activity in local economies

Socioeconomic study Northern GSA 6: Social and economic characterization of professional fishing activity

Pilot study: Analysis of one fishing port (Vilanova i la Geltrú).

Method: Personal interview to all fishermen (Ship owners, Skippers, Crew).

55 active fishing vessels.

96% of Vessel owners and Skippers interviewed (53 vessels).

180 surveys delivered to the crew.

96% of the crew surveyed (173 fishermen).

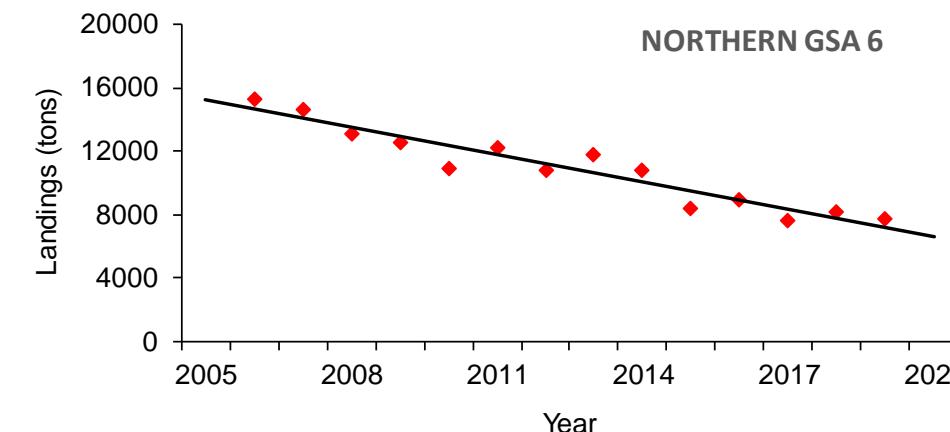

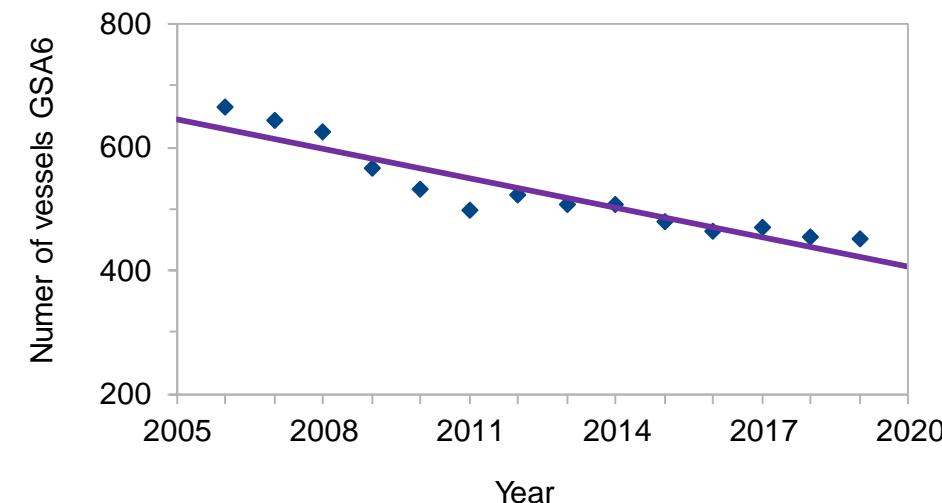

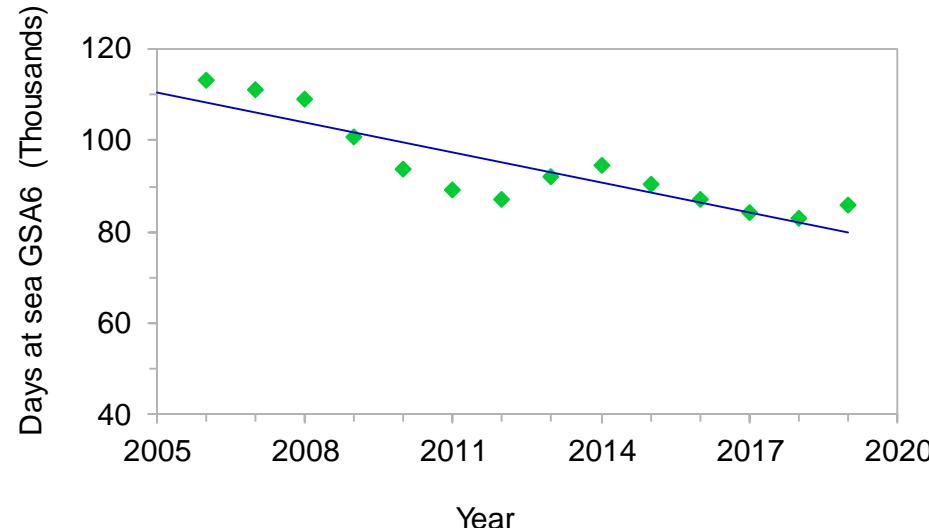

Expected RESULTS

Social: Fishermen by boat, Studies level, Nationalities, Experience, ...

Fishing characterization: Seasonality of fishing, Job time distribution, ...

Economic: Indebtedness level, Main expenses, Revenues distribution

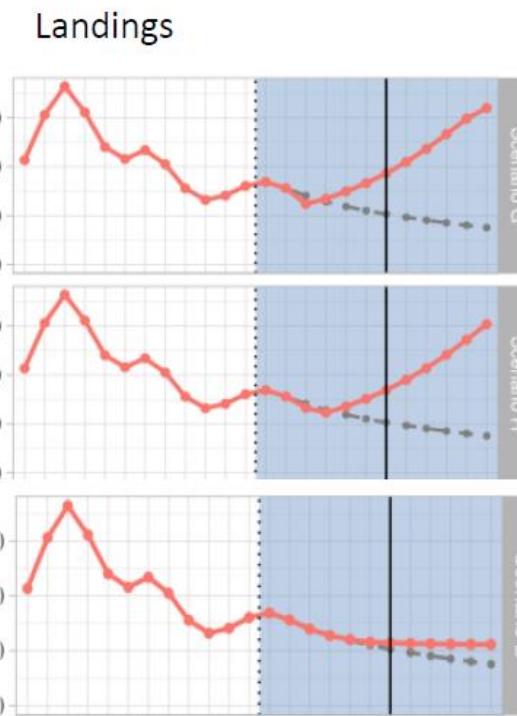

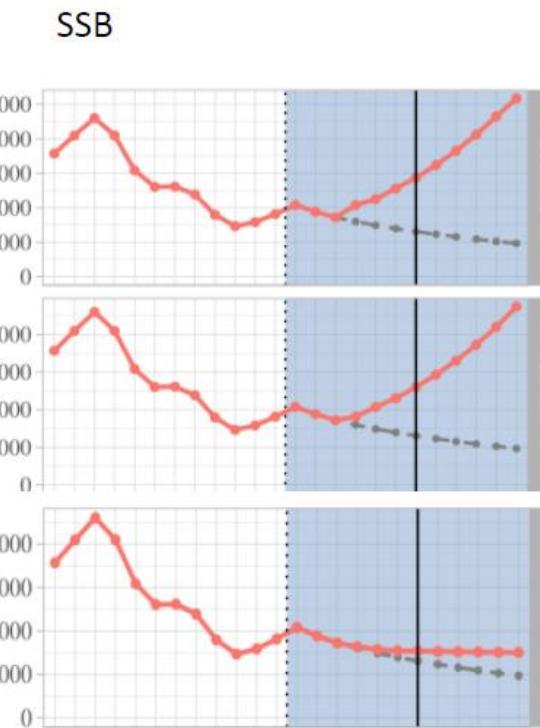

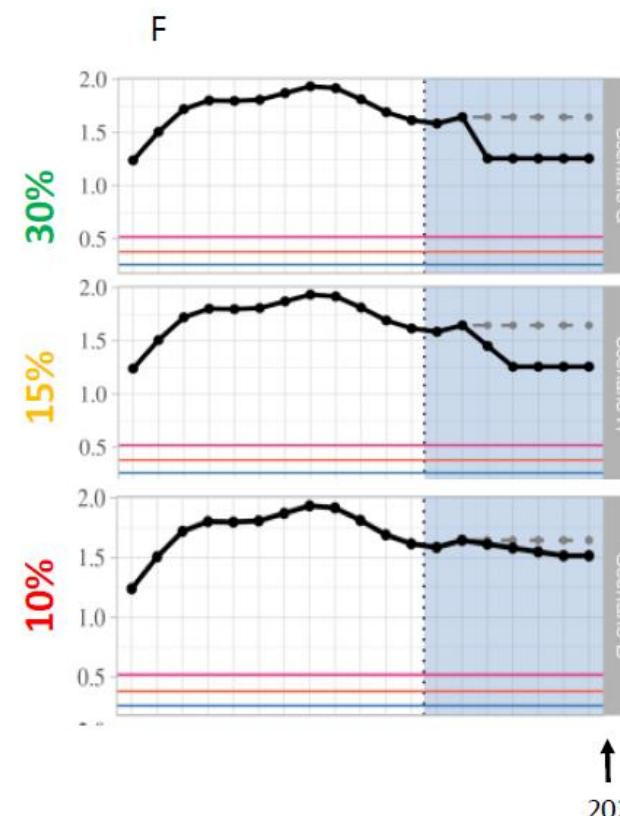

Fishery indicators of the last 15 years in northern GSA6: diminution of number of days and number vessels

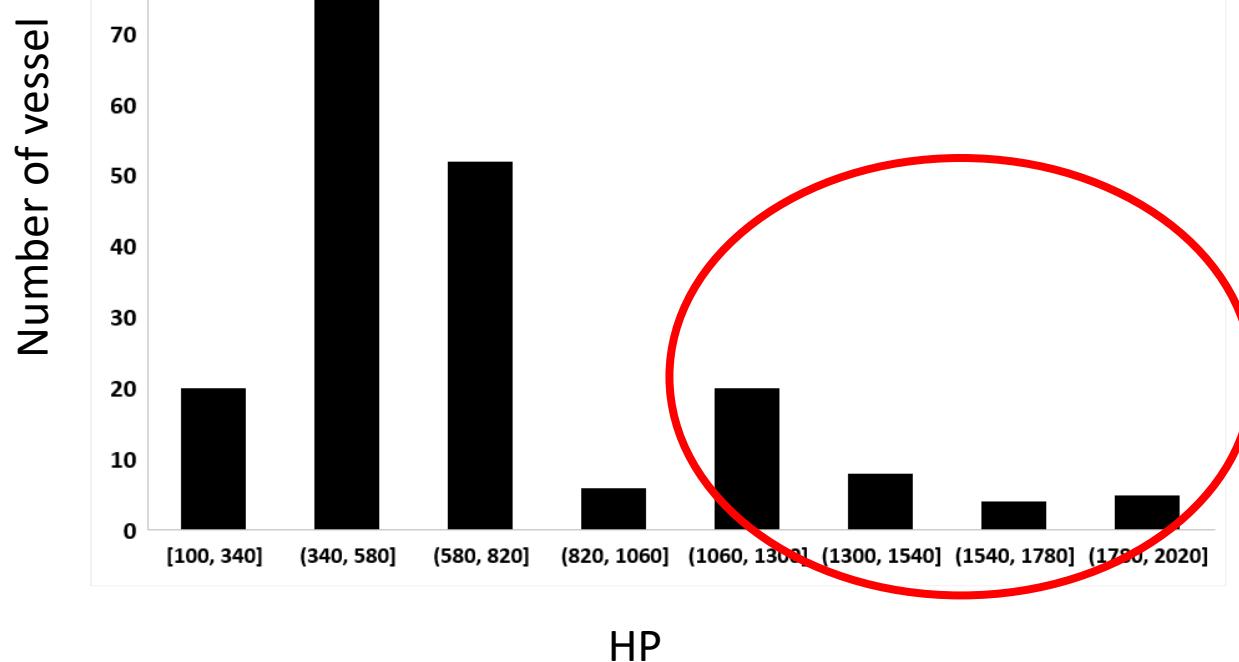

Last simulations of WMED Working Group: to be validated in next STECF meeting

Validation in Nov.
 2020

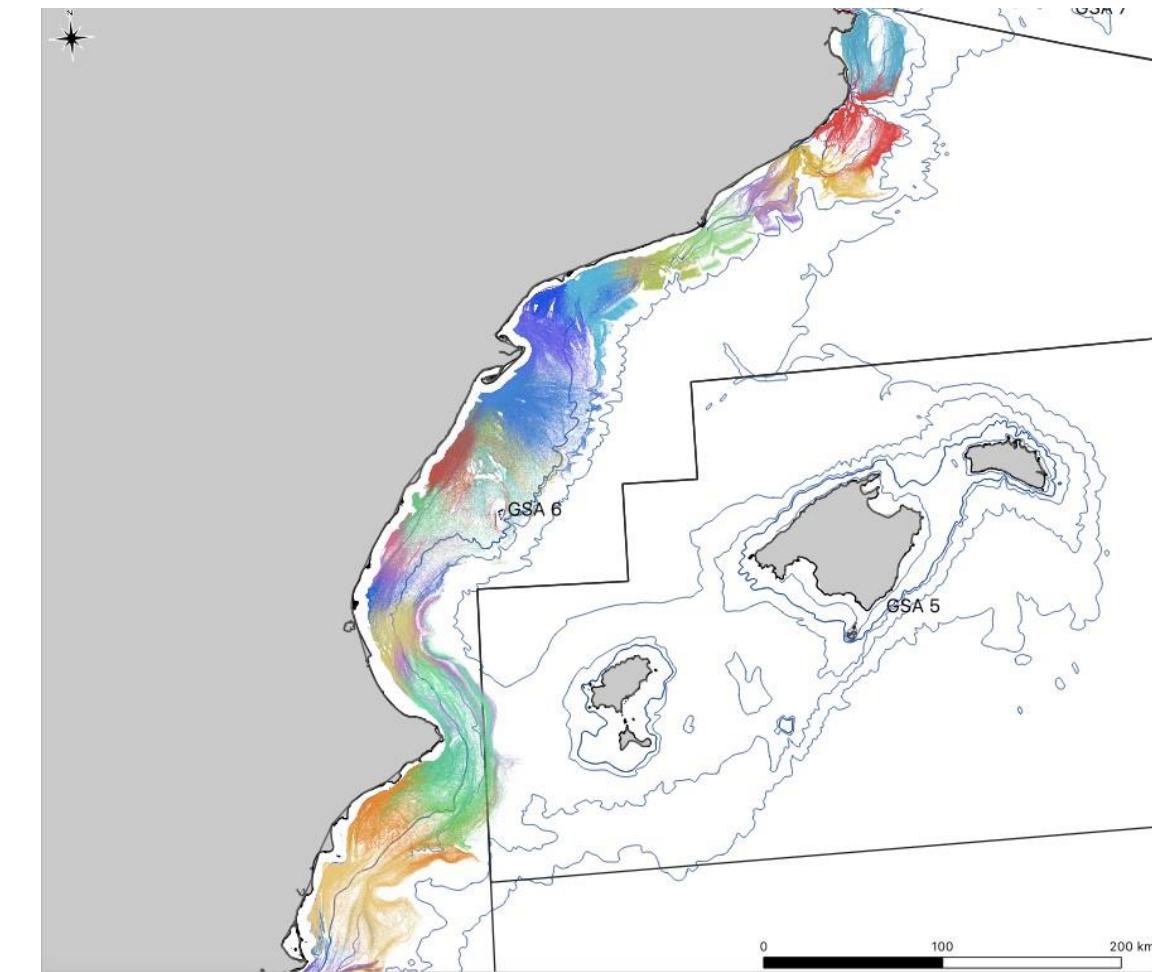

Simulations 2020-2030
 HAKE Fishing Mortality, Biomass and Landings

Horsepower of northern GSA 6 (Catalonia region)

Spatial fishing footprint by each local fleet

How the U.E. Multiannual Plan is approaching this overexploitation situation?

Fishery management criteria mentioned in the new EU-MAP with the objective to obtain a MSY of demersal exploited stocks

1. Article 7 “*Fishing Effort Regime*”: fishery management by 10 % annual reduction of fishing effort up to a 30% (mainly by reducing days at sea).

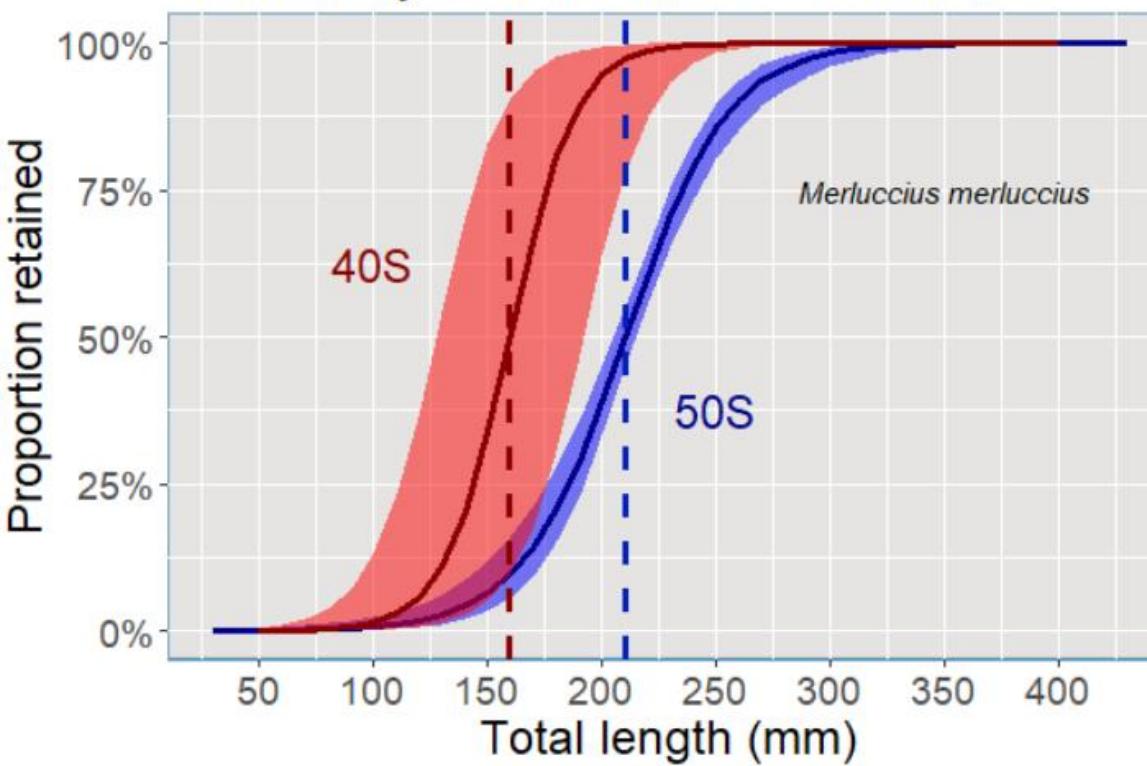

2. Article 11 “*Closure areas*”: spatial fishery management.

Management measures as complementary to the ones proposed on Articles 7 and 11

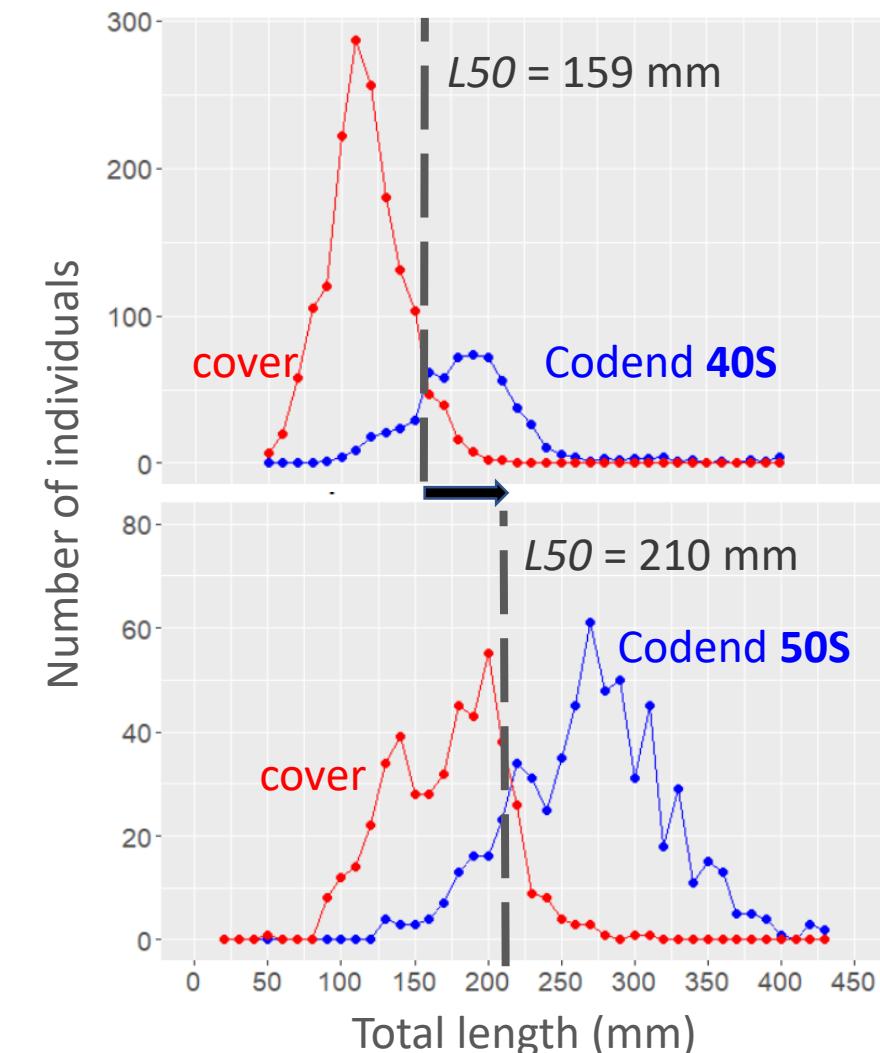

- a) *Codend mesh selectivity.*
- b) *Habitat recovery and restoration:* Small No-Take fishing areas distributed along the entire coastline in the northern part of the fishing grounds of each of the fisherman's association.
- c) Fishing capacity by engine limitations or technical gear measures.

Hake gear selectivity: 50 mm vs 40 mm square mesh size

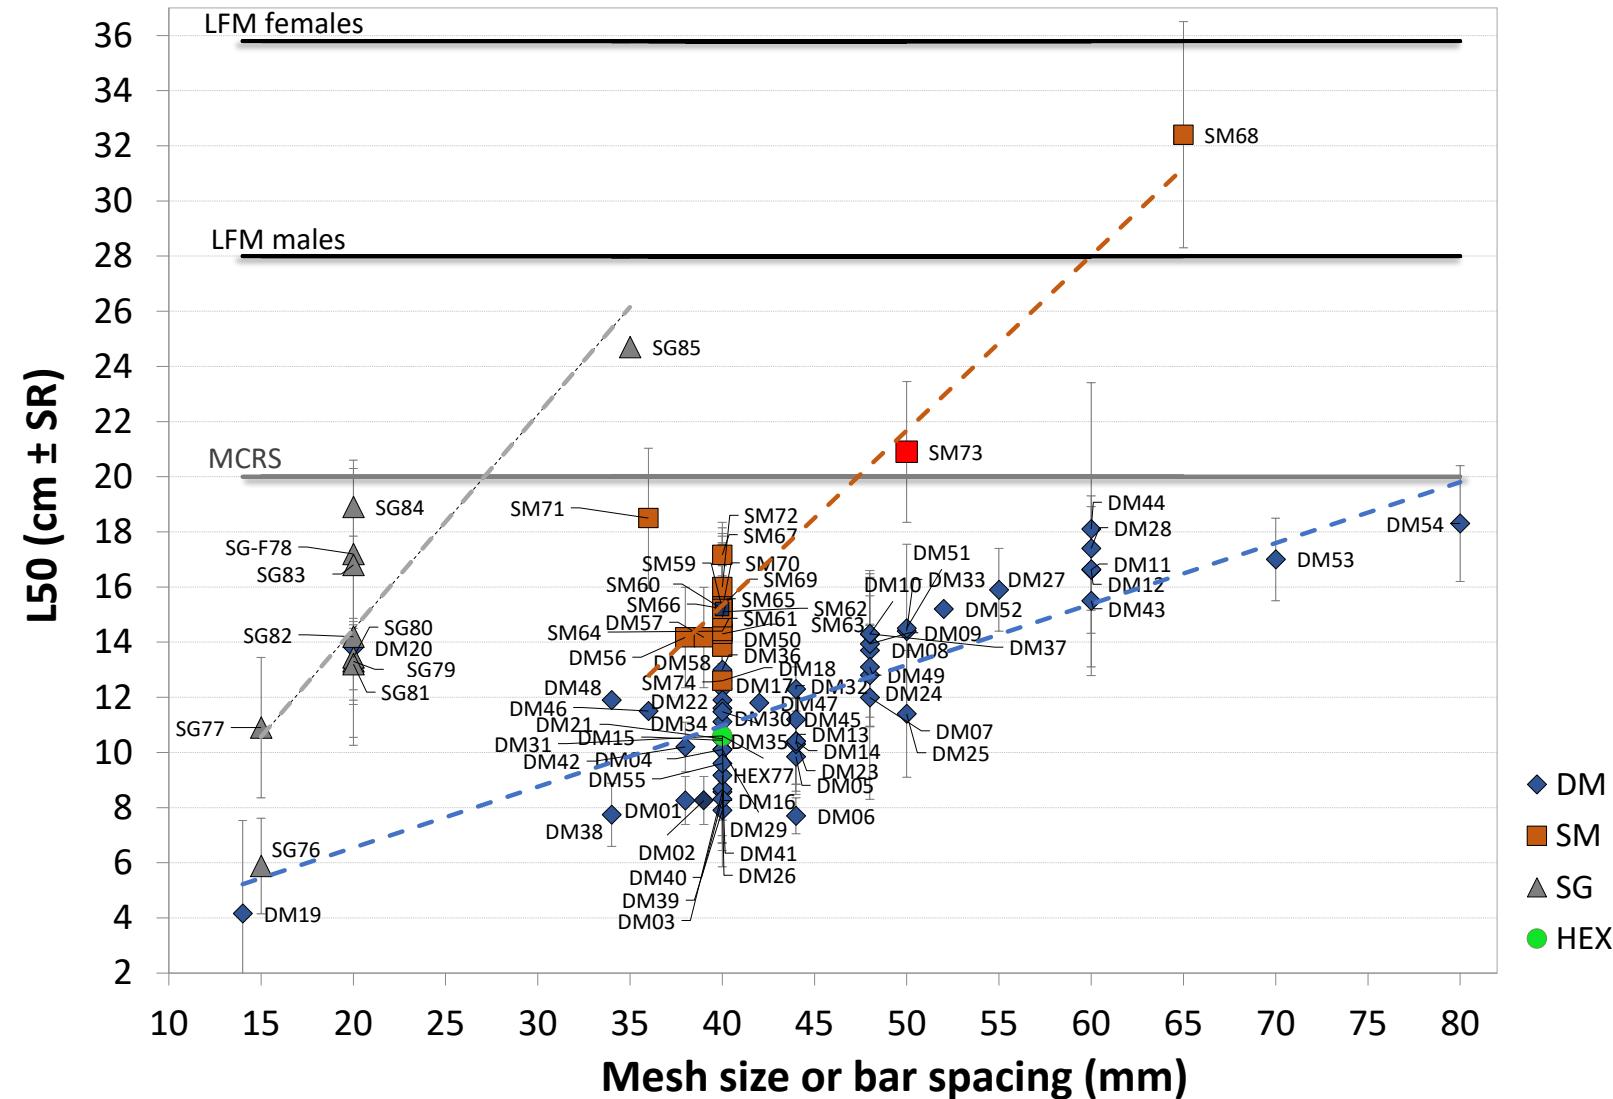

Selectivity of 40S and 50S codends

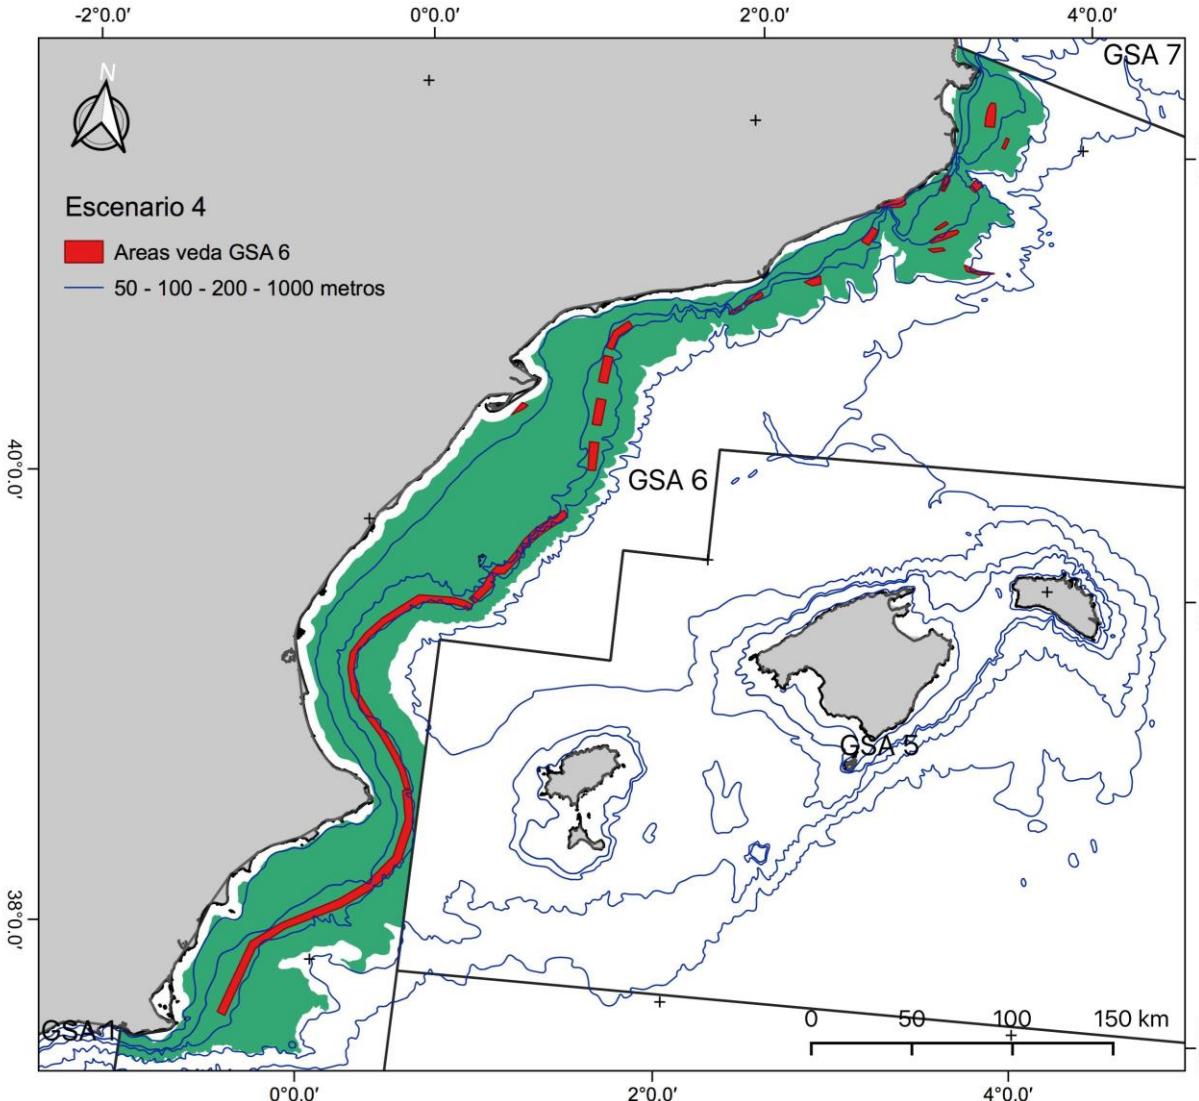

Merluccius merluccius

Hake gear selectivity: diamond mesh vs square mesh

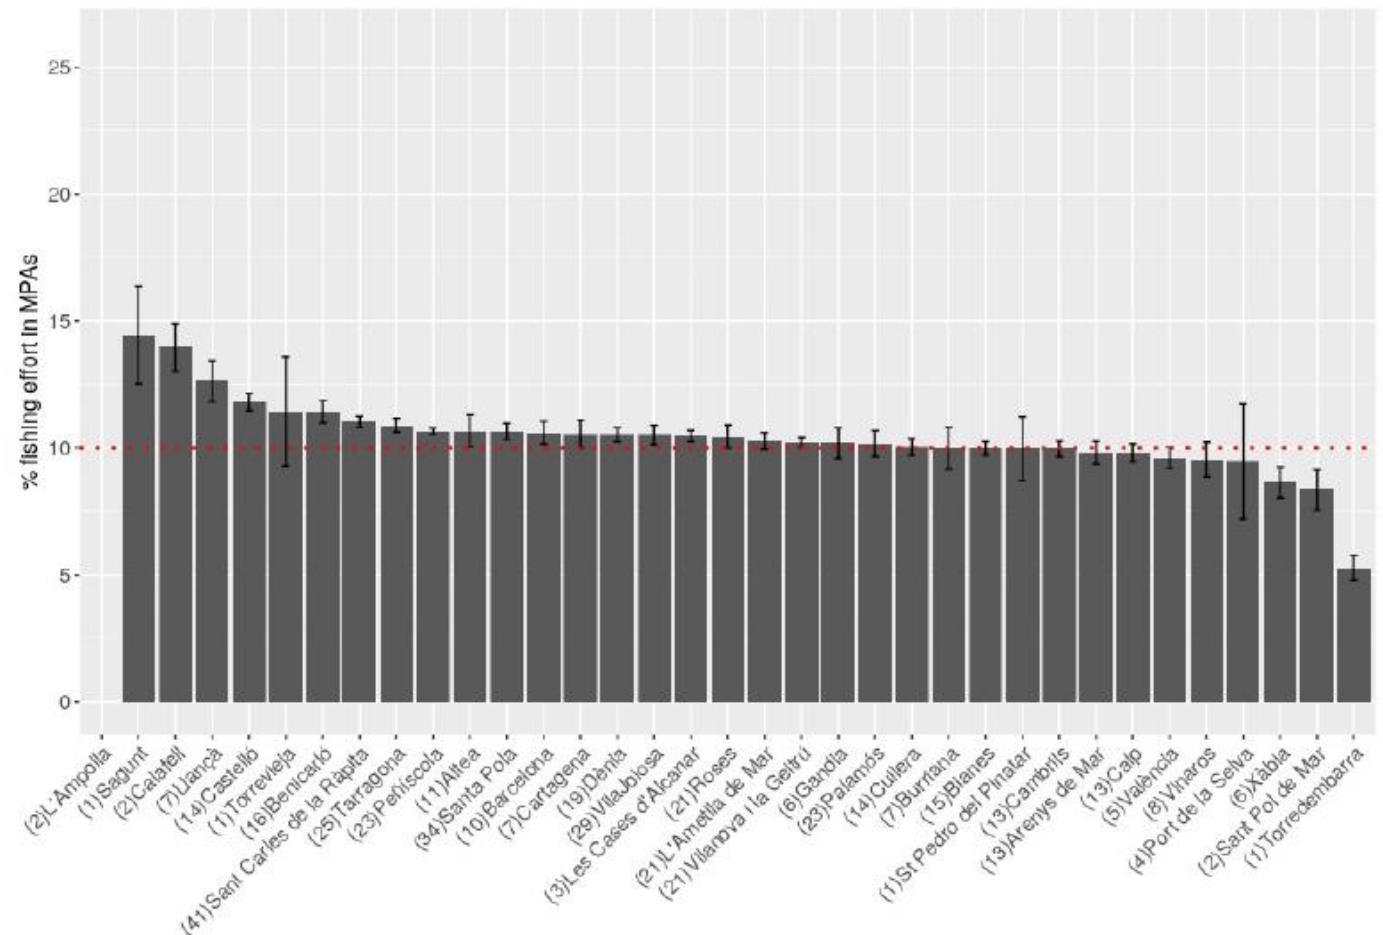

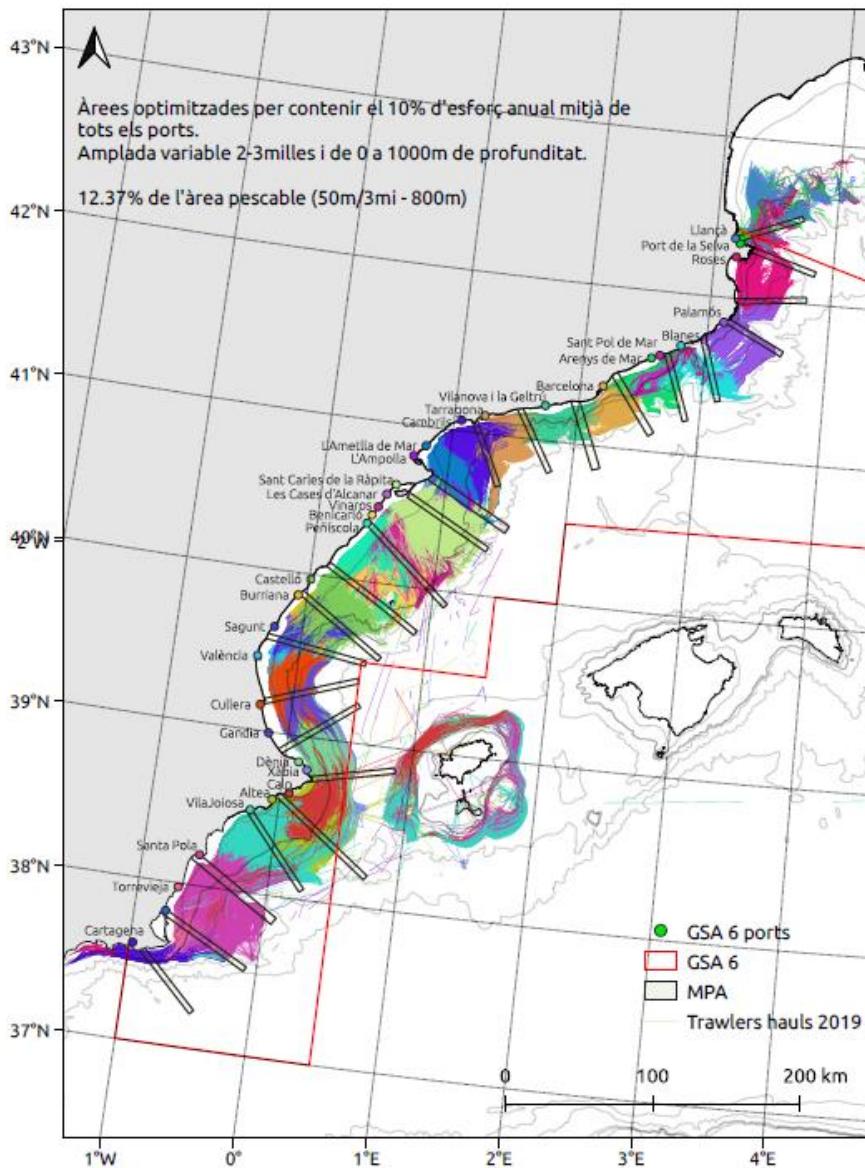

Article 11.2 and 11.3: Habitat recovery and restoration

ID	No-take zone	Área (km ²)	Subregion	Total fishing,K m ²	% Protected area
1	Área de interés pesquero para la merluza de Roses	51,35	Girona	4848,67	4,69
